EngiCare ER Diagram (proposal v0.1)

Status: drafted by Fahrettin (database owner).

Fixed value lists

Column	Allowed values
`users.role`	student, staff, faculty_member, technician, admin
`users.department`	civil, mechanical, electrical, computer, chemical, general
`reports.status`	pending, under_review, in_progress, resolved, rejected
`reports.priority`	low, medium, high, urgent
`reports.category`	electrical, plumbing, hvac, furniture, it_equipment, lab_equipment, internet, cleanliness, safety, structural, other
`reports.building_id`	main, civil, mechanical, electrical, computer, chemical, labs, library
`timeline_entries.type`	created, status_changed, assigned, resolved, rejected

Design notes

- `reports` stores `status`, `resolved_at`, `rejection_reason` and `updated_at` directly, updated in the same transaction as each timeline entry.
- `reference_number` (format `ENG-YYYY-NNNN`) is unique and generated by the backend from a database sequence.
- `assignee_id` is nullable. The rule "assignee must have role technician" is enforced in the service layer.
- The reporter is always stored. Identity masking for other users happens in the API response, not in the database.
- `report_attachments.url` stores a link, not the file. File storage location is still to be decided.
- No session or token table: authentication uses stateless JWTs.
